

### 1. Business Problem

# 1.1 Problem Description

Netflix is all about connecting people to the movies they love. To help customers find those movies, they developed world-class movie recommendation system: CinematchSM. Its job is to predict whether someone will enjoy a movie based on how much they liked or disliked other movies. Netflix use those predictions to make personal movie recommendations based on each customer's unique tastes. And while **Cinematch** is doing pretty well, it can always be made better.

Now there are a lot of interesting alternative approaches to how Cinematch works that netflix haven't tried. Some are described in the literature, some aren't. We're curious whether any of these can beat Cinematch by making better predictions. Because, frankly, if there is a much better approach it could make a big difference to our customers and our business.

Credits: https://www.netflixprize.com/rules.html

#### 1.2 Problem Statement

Netflix provided a lot of anonymous rating data, and a prediction accuracy bar that is 10% better than what Cinematch can do on the same training data set. (Accuracy is a measurement of how closely predicted ratings of movies match subsequent actual ratings.)

# 1.4 Real world/Business Objectives and constraints

#### Objectives:

- 1. Predict the rating that a user would give to a movie that he ahs not yet rated.
- 2. Minimize the difference between predicted and actual rating (RMSE and MAPE)

#### Constraints:

1. Some form of interpretability.

# 2. Machine Learning Problem

### 2.1 Data

#### 2.1.1 Data Overview

Get the data from: https://www.kaggle.com/netflix-inc/netflix-prize-data/data

Data files:

- combined\_data\_1.txt
- combined\_data\_2.txt
- combined\_data\_3.txt
- combined\_data\_4.txt
- movie\_titles.csv

The first line of each file [combined\_data\_1.txt, combined\_data\_2.txt, combined\_data\_3.txt, combined\_data\_4.txt] contains the movie

CustomerID, Rating, Date

MovieIDs range from 1 to 17770 sequentially.

CustomerIDs range from 1 to 2649429, with gaps. There are 480189 users.

Ratings are on a five star (integral) scale from 1 to 5.

Dates have the format YYYY-MM-DD.

# 2.2 Mapping the real world problem to a Machine Learning Problem

### 2.2.1 Type of Machine Learning Problem

```
For a given movie and user we need to predict the rating would be given by him/her to the movie. The given problem is a Recommendation problem

It can also seen as a Regression problem
```

#### 2.2.2 Performance metric

- Mean Absolute Percentage Error: https://en.wikipedia.org/wiki/Mean\_absolute\_percentage\_error
- Root Mean Square Error: https://en.wikipedia.org/wiki/Root-mean-square\_deviation

### 2.2.3 Machine Learning Objective and Constraints

- 1. Minimize RMSE.
- 2. Try to provide some interpretability.

```
# this is just to know how much time will it take to run this entire ipython notebook
from datetime import datetime
# globalstart = datetime.now()
import pandas as pd
```

```
import numpy as np
import matplotlib
matplotlib.use('nbagg')

import matplotlib.pyplot as plt
plt.rcParams.update({'figure.max_open_warning': 0})

import seaborn as sns
sns.set_style('whitegrid')
import os
from scipy import sparse
from scipy.sparse import csr_matrix

from sklearn.decomposition import TruncatedSVD
from sklearn.metrics.pairwise import cosine_similarity
import random
```

# 3. Exploratory Data Analysis

# 3.1 Preprocessing

### 3.1.1 Converting / Merging whole data to required format: u\_i, m\_j, r\_ij

```
start = datetime.now()
if not os.path.isfile('data.csv'):
    # Create a file 'data.csv' before reading it
    # Read all the files in netflix and store them in one big file('data.csv')
    # We re reading from each of the four files and appendig each rating to a global file 'train.csv'
```

```
data = open('data.csv', mode='w')
    row = list()
   files=['data folder/combined data 1.txt','data folder/combined data 2.txt',
           'data folder/combined data 3.txt', 'data folder/combined data 4.txt']
    for file in files:
        print("Reading ratings from {}...".format(file))
        with open(file) as f:
            for line in f:
                del row[:] # you don't have to do this.
                line = line.strip()
                if line.endswith(':'):
                    # All below are ratings for this movie, until another movie appears.
                    movie id = line.replace(':', '')
                else:
                    row = [x for x in line.split(',')]
                    row.insert(0, movie id)
                    data.write(','.join(row))
                    data.write('\n')
        print("Done.\n")
    data.close()
print('Time taken :', datetime.now() - start)
     Reading ratings from data folder/combined data 1.txt...
     Done.
     Reading ratings from data folder/combined data 2.txt...

### 3.3.2 Number of Ratings per a month

```
ax = train_df.resample('m', on='date')['rating'].count().plot()
ax.set_title('No of ratings per month (Training data)')
plt.xlabel('Month')
plt.ylabel('No of ratings(per month)')
ax.set_yticklabels([human(item, 'M') for item in ax.get_yticks()])
plt.show()
```

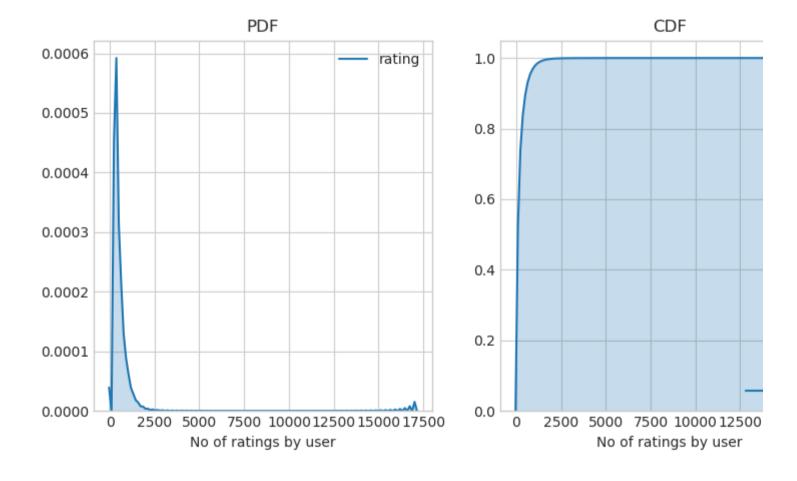

```
fig = plt.figure(figsize=plt.figaspect(.5))

ax1 = plt.subplot(121)
sns.kdeplot(no_of_rated_movies_per_user, shade=True, ax=ax1)
plt.xlabel('No of ratings by user')
plt.title("PDF")

ax2 = plt.subplot(122)
```

```
sns.kdeplot(no_of_rated_movies_per_user, shade=True, cumulative=True,ax=ax2)
plt.xlabel('No of ratings by user')
plt.title('CDF')
plt.show()
```

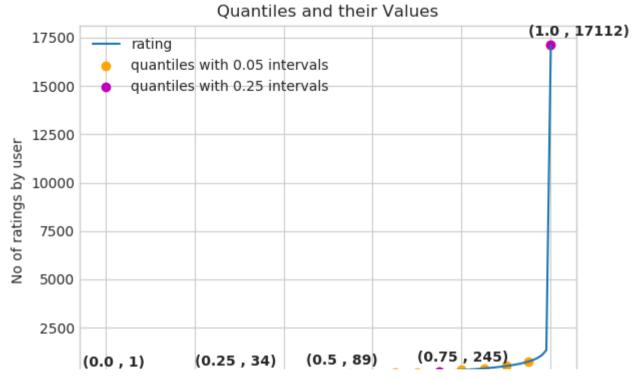

no\_of\_rated\_movies\_per\_user.describe()

count 405041.000000 mean 198.459921

```
std 290.793238
min 1.000000
25% 34.000000
50% 89.000000
75% 245.000000
max 17112.000000
Name: rating, dtype: float64
```

There, is something interesting going on with the quantiles..

quantiles[::5]

| 0.00 | 1   |
|------|-----|
| 0.05 | 7   |
| 0.10 | 15  |
| 0.15 | 21  |
| 0.20 | 27  |
| 0.25 | 34  |
| 0.30 | 41  |
| 0.35 | 50  |
| 0.40 | 60  |
| 0.45 | 73  |
| 0.50 | 89  |
| 0.55 | 109 |
| 0.60 | 133 |
| 0.65 | 163 |
| 0.70 | 199 |

```
0.75    245
0.80    307
0.85    392
0.90    520
0.95    749
1.00    17112
Name: rating, dtype: int64
```

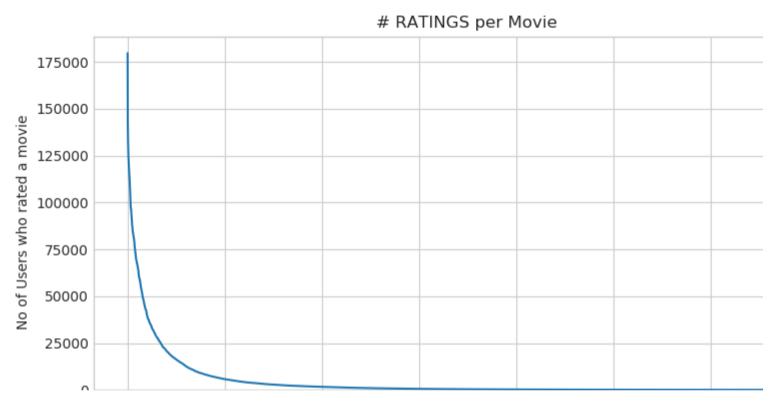

#### how many ratings at the last 5% of all ratings??

```
print('\n No of ratings at last 5 percentile : {}\n'.format(sum(no_of_rated_movies_per_user>= 749)) )
    No of ratings at last 5 percentile : 20305
```

### 3.3.4 Analysis of ratings of a movie given by a user

```
no_of_ratings_per_movie = train_df.groupby(by='movie')['rating'].count().sort_values(ascending=False)

fig = plt.figure(figsize=plt.figaspect(.5))
ax = plt.gca()
plt.plot(no_of_ratings_per_movie.values)
plt.title('# RATINGS per Movie')
plt.xlabel('Movie')
plt.ylabel('No of Users who rated a movie')
ax.set_xticklabels([])
```

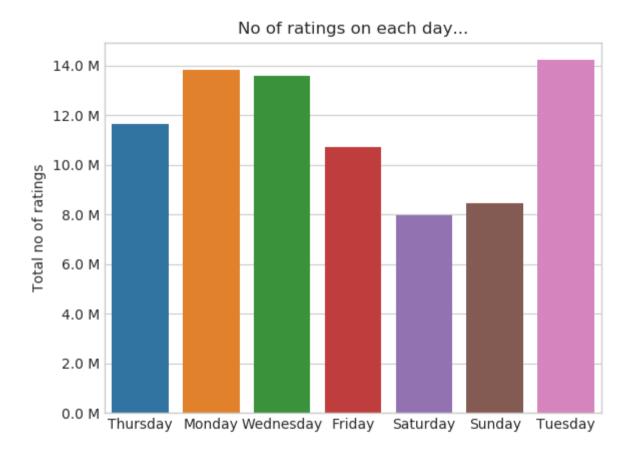

- It is very skewed.. just like nunmber of ratings given per user.
- There are some movies (which are very popular) which are rated by huge number of users.
- But most of the movies(like 90%) got some hundereds of ratings.

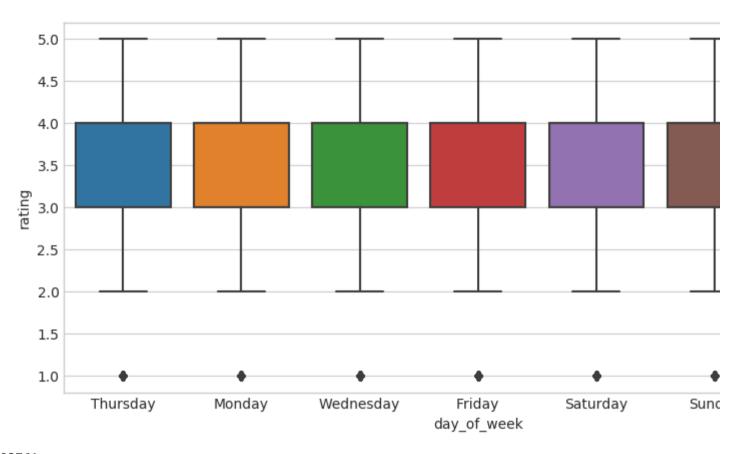

## 3.3.5 Number of ratings on each day of the week

```
fig, ax = plt.subplots()
sns.countplot(x='day_of_week', data=train_df, ax=ax)
```

```
plt.title('No of ratings on each day...')
plt.ylabel('Total no of ratings')
plt.xlabel('')
ax.set_yticklabels([human(item, 'M') for item in ax.get_yticks()])
plt.show()
```

```
start = datetime.now()
fig = plt.figure(figsize=plt.figaspect(.45))
sns.boxplot(y='rating', x='day_of_week', data=train_df)
plt.show()
print(datetime.now() - start)
```

0:01:10.003761

```
day of week
Friday
             3.585274
Monday
             3.577250
Saturday
            3.591791
Sunday
            3.594144
Thursday
         3.582463
Tuesday
            3.574438
Wednesday
            3.583751

### 3.3.6 Creating sparse matrix from data frame

#### 3.3.6.1 Creating sparse matrix from train data frame

```
print('Done. It\'s shape is : (user, movie) : ',train_sparse_matrix.shape)
print('Saving it into disk for furthur usage..')
# save it into disk
sparse.save_npz("train_sparse_matrix.npz", train_sparse_matrix)
print('Done..\n')

print(datetime.now() - start)

We are creating sparse_matrix from the dataframe..
    Done. It's shape is : (user, movie) : (2649430, 17771)
    Saving it into disk for furthur usage..
    Done..

0:01:13.804969
```

#### The Sparsity of Train Sparse Matrix

```
us,mv = train_sparse_matrix.shape
elem = train_sparse_matrix.count_nonzero()

print("Sparsity Of Train matrix : {} % ".format( (1-(elem/(us*mv))) * 100) )

Sparsity Of Train matrix : 99.8292709259195 %
```

### 3.3.6.2 Creating sparse matrix from test data frame

```
start = datetime.now()
if os.path.isfile('test_sparse_matrix.npz'):
    print("It is present in your pwd, getting it from disk....")
    # just get it from the disk instead of computing it
    test_sparse_matrix = sparse.load_npz('test_sparse_matrix.npz')
    print("DONE..")
else:
    print("We are creating sparse_matrix from the dataframe..")
```

```
# create sparse matrix and store it for after usage.
   # csr_matrix(data_values, (row_index, col_index), shape_of_matrix)
   # It should be in such a way that, MATRIX[row, col] = data
   test sparse matrix = sparse.csr matrix((test df.rating.values, (test df.user.values,
                                               test df.movie.values)))
   print('Done. It\'s shape is : (user, movie) : ',test_sparse_matrix.shape)
    print('Saving it into disk for furthur usage..')
   # save it into disk
    sparse.save npz("test sparse matrix.npz", test sparse matrix)
    print('Done..\n')
print(datetime.now() - start)
     We are creating sparse matrix from the dataframe...
     Done. It's shape is : (user, movie) : (2649430, 17771)
     Saving it into disk for furthur usage..
     Done..
     0:00:18.566120
```

#### The Sparsity of Test data Matrix

3.3.7 Finding Global average of all movie ratings, Average rating per user, and Average rating per movie

```
# get the user averages in dictionary (key: user id/movie id, value: avg rating)
```

```
def get average ratings(sparse matrix, of users):
    # average ratings of user/axes
    ax = 1 if of users else 0 # 1 - User axes,0 - Movie axes
    # ".A1" is for converting Column Matrix to 1-D numpy array
    sum of ratings = sparse matrix.sum(axis=ax).A1
    # Boolean matrix of ratings ( whether a user rated that movie or not)
   is rated = sparse matrix!=0
    # no of ratings that each user OR movie..
    no of ratings = is rated.sum(axis=ax).A1
    # max user and max movie ids in sparse matrix
    u,m = sparse matrix.shape
    # creae a dictonary of users and their average ratigns..
    average ratings = { i : sum of ratings[i]/no of ratings[i]
                                 for i in range(u if of users else m)
                                    if no of ratings[i] !=0}
    # return that dictionary of average ratings
    return average ratings
```

#### 3.3.7.1 finding global average of all movie ratings

### 3.3.7.2 finding average rating per user

```
train_averages['user'] = get_average_ratings(train_sparse_matrix, of_users=True)
print('\nAverage rating of user 10 :',train_averages['user'][10])
```

Average rating of user 10 : 3.3781094527363185

#### 3.3.7.3 finding average rating per movie

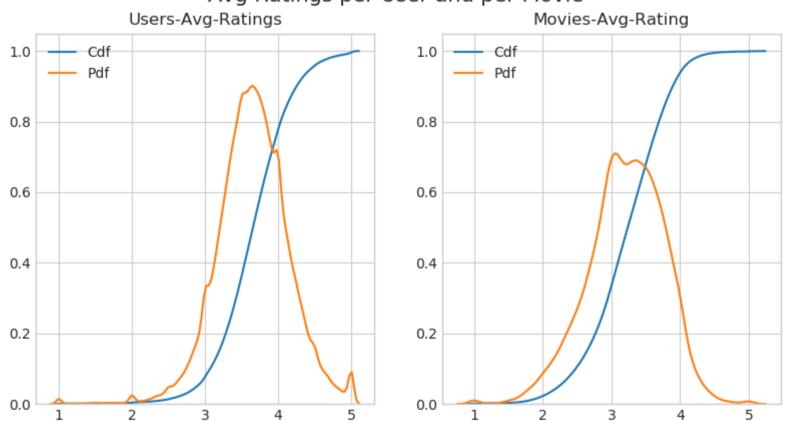

```
train_averages['movie'] = get_average_ratings(train_sparse_matrix, of_users=False)
print('\n AVerage rating of movie 15 :',train_averages['movie'][15])
```

AVerage rating of movie 15 : 3.3038461538461537

Double-click (or enter) to edit

#### 3.3.7.4 PDF's & CDF's of Avg.Ratings of Users & Movies (In Train Data)

# Avg Ratings per User and per Movie

0:00:35.003443

### 3.3.8 Cold Start problem

#### 3.3.8.1 Cold Start problem with Users

We might have to handle **new users** ( **75148** ) who didn't appear in train data.

### 3.3.8.2 Cold Start problem with Movies

```
Total number of Movies : 17770

Number of Users in Train data : 17424

No of Movies that didn't appear in train data: 346(1.95 %)
```

We might have to handle 346 movies (small comparatively) in test data

## 3.4 Computing Similarity matrices

### 3.4.1 Computing User-User Similarity matrix

- 1. Calculating User User Similarity\_Matrix is **not very easy**(unless you have huge Computing Power and lots of time) because of number of. usersbeing lare.
  - o You can try if you want to. Your system could crash or the program stops with Memory Error

#### 3.4.1.1 Trying with all dimensions (17k dimensions per user)

```
from sklearn.metrics.pairwise import cosine_similarity
```

```
def compute_user_similarity(sparse_matrix, compute_for_few=False, top = 100, verbose=False, verb_for_n_rows = 20,
```

```
draw time taken=True):
no of users, = sparse matrix.shape
# get the indices of non zero rows(users) from our sparse matrix
row ind, col ind = sparse matrix.nonzero()
row ind = sorted(set(row ind)) # we don't have to
time taken = list() # time taken for finding similar users for an user..
# we create rows, cols, and data lists..., which can be used to create sparse matrices
rows, cols, data = list(), list(), list()
if verbose: print("Computing top", top, "similarities for each user..")
start = datetime.now()
temp = 0
for row in row ind[:top] if compute for few else row ind:
    temp = temp+1
    prev = datetime.now()
    # get the similarity row for this user with all other users
    sim = cosine similarity(sparse matrix.getrow(row), sparse matrix).ravel()
    # We will get only the top ''top'' most similar users and ignore rest of them..
    top sim ind = sim.argsort()[-top:]
    top sim val = sim[top sim ind]
    # add them to our rows, cols and data
    rows.extend([row]*top)
    cols.extend(top sim ind)
    data.extend(top sim val)
    time taken.append(datetime.now().timestamp() - prev.timestamp())
    if verbose:
        if temp%verb for n rows == 0:
            print("computing done for {} users [ time elapsed : {} ]"
                  .format(temp, datetime.now()-start))
# lets create sparse matrix out of these and return it
if verbose: print('Creating Sparse matrix from the computed similarities')
```

```
Computing top 100 similarities for each user..

computing done for 20 users [ time elapsed : 0:03:20.300488 ]

computing done for 40 users [ time elapsed : 0:06:38.518391 ]

computing done for 60 users [ time elapsed : 0:09:53.143126 ]

computing done for 80 users [ time elapsed : 0:13:10.080447 ]

computing done for 100 users [ time elapsed : 0:16:24.711032 ]

Creating Sparse matrix from the computed similarities
```

#### 3.4.1.2 Trying with reduced dimensions (Using TruncatedSVD for dimensionality reduction of user vector)

Double-click (or enter) to edit

- We have 405,041 users in out training set and computing similarities between them..( 17K dimensional vector..) is time consuming..
- From above plot, It took roughly 8.88 sec for computing simlilar users for one user
- We have **405,041 users** with us in training set.
- $405041 \times 8.88 = 3596764.08 \,\mathrm{sec} = 59946.068 \,\mathrm{min} = 999.101133333 \,\mathrm{hours} = 41.629213889 \,\mathrm{days}...$ 
  - Even if we run on 4 cores parallelly (a typical system now a days), It will still take almost 10 and 1/2 days.

IDEA: Instead, we will try to reduce the dimentsions using SVD, so that it might speed up the process...

```
from datetime import datetime from sklearn.decomposition import TruncatedSVD
```

```
start = datetime.now()

# initilaize the algorithm with some parameters..

# All of them are default except n_components. n_itr is for Randomized SVD solver.

netflix_svd = TruncatedSVD(n_components=500, algorithm='randomized', random_state=15)

trunc_svd = netflix_svd.fit_transform(train_sparse_matrix)

print(datetime.now()-start)

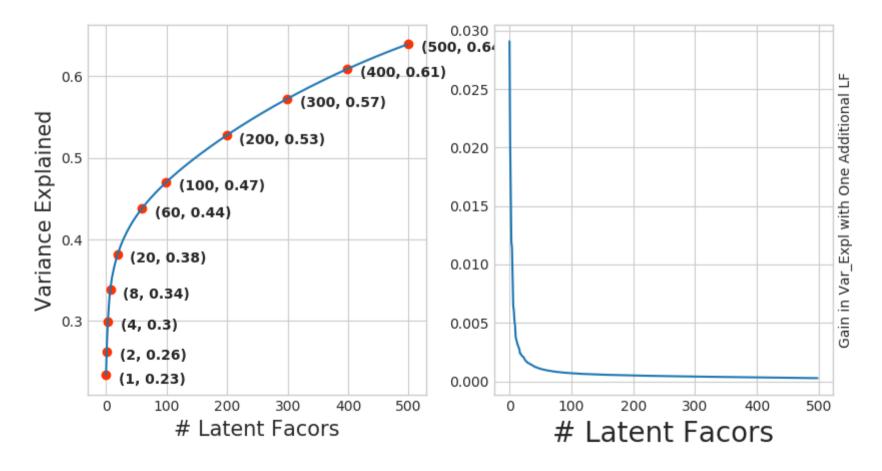

0:29:07.069783
```

Here,

- $\sum \longleftarrow$  (netflix\_svd.singular\_values\_)
- $\bigvee^T \longleftarrow$  (netflix\_svd.components\_)
- [ ] is not returned. instead **Projection\_of\_X** onto the new vectorspace is returned.
- It uses randomized svd internally, which returns All 3 of them saperately. Use that instead...

```
ax2.plot(change_in_expl_var)
```

```
ax2.set_ylabel("Gain in Var_Expl with One Additional LF", fontsize=10)
ax2.yaxis.set_label_position("right")
ax2.set_xlabel("# Latent Facors", fontsize=20)
plt.show()
```

for i in ind:

```
print("({}, {})".format(i, np.round(expl_var[i-1], 2)))

(1, 0.23)
(2, 0.26)
(4, 0.3)
(8, 0.34)
(20, 0.38)
(60, 0.44)
(100, 0.47)
(200, 0.53)
(300, 0.57)
(400, 0.61)
(500, 0.64)
```

#### I think 500 dimensions is good enough

- By just taking (20 to 30) latent factors, explained variance that we could get is 20 %.
- To take it to 60%, we have to take almost 400 latent factors. It is not fare.
- It basically is the gain of variance explained, if we add one additional latent factor to it.
- By adding one by one latent factore too it, the **\_gain in expained variance** with that addition is decreasing. (Obviously, because they are sorted that way).
- LHS Graph:
  - ∘ x --- ( No of latent factos ),
  - y --- ( The variance explained by taking x latent factors)
- \_\_More decrease in the line (RHS graph) \_\_:
  - · We are getting more expained variance than before.
- Less decrease in that line (RHS graph):
  - We are not getting benifitted from adding latent factor furthur. This is what is shown in the plots.

#### • RHS Graph:

• Let's convert this to actual sparse matrix and store it for future purposes

```
print("-"*50)
print("time:",datetime.now()-start)
```

```
Computing top 50 similarities for each user..

computing done for 10 users [ time elapsed : 0:02:09.746324 ]

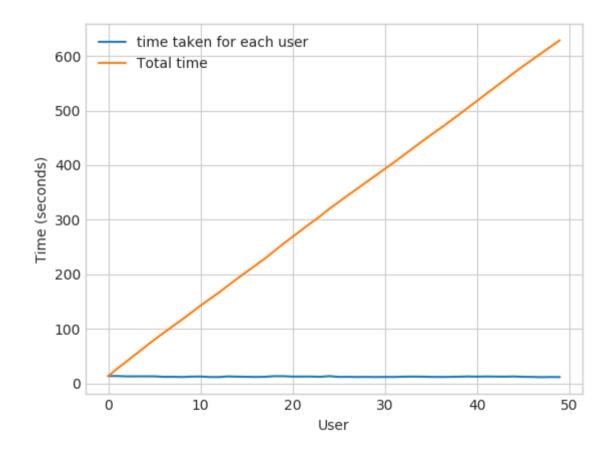

computing done for 20 users [ time elapsed : 0:04:16.017768 ]

computing done for 30 users [ time elapsed : 0:06:20.861163 ]

computing done for 40 users [ time elapsed : 0:08:24.933316 ]

computing done for 50 users [ time elapsed : 0:10:28.861485 ]

Creating Sparse matrix from the computed similarities
```

time: 0:10:52.658092

#### : This is taking more time for each user than Original one.

- from above plot, It took almost 12.18 for computing simlilar users for one user
- We have 405041 users with us in training set.
- $405041 \times 12.18 ==== 4933399.38 \text{ sec} ==== 82223.323 \text{ min} ==== 1370.388716667 \text{ hours} ==== 57.099529861 \text{ days.}..$ 
  - Even we run on 4 cores parallelly (a typical system now a days), It will still take almost \_\_(14 15) \_\_ days.
- Why did this happen...??

#### Is there any other way to compute user user similarity..??

-An alternative is to compute similar users for a particular user, whenenver required (ie., Run time) - We maintain a binary Vector for users, which tells us whether we already computed or not.. - If not: - Compute top (let's just say, 1000) most similar users for this given user, and add this to our datastructure, so that we can just access it(similar users) without recomputing it again. - - If It is already Computed: - Just get it directly from our datastructure, which has that information. - In production time, We might have to recompute similarities, if it is computed a long time ago. Because user preferences changes over time. If we could maintain some kind of Timer, which when expires, we have to update it (recompute it). -- Which datastructure to use: - It is purely implementation dependant. - One simple method is to maintain a Dictionary Of Dictionaries. -- key: userid - value: Again a dictionary - key: Similar User - value: Similarity Value

# 3.4.2 Computing Movie-Movie Similarity matrix

```
start = datetime.now()
if not os.path.isfile('m m sim sparse.npz'):
    print("It seems you don't have that file. Computing movie movie similarity...")
    start = datetime.now()
    m m sim sparse = cosine similarity(X=train sparse matrix.T, dense output=False)
    print("Done..")
    # store this sparse matrix in disk before using it. For future purposes.
    print("Saving it to disk without the need of re-computing it again.. ")
    sparse.save npz("m m sim sparse.npz", m m sim sparse)
    print("Done..")
else:
    print("It is there, We will get it.")
    m m sim sparse = sparse.load npz("m m sim sparse.npz")
    print("Done ...")
print("It's a ",m m sim sparse.shape," dimensional matrix")
print(datetime.now() - start)
     It seems you don't have that file. Computing movie movie similarity...
     Done..
     Saving it to disk without the need of re-computing it again..
     Done..
     It's a (17771, 17771) dimensional matrix
     0:10:02.736054
m m sim sparse.shape
     (17771, 17771)
```

- Even though we have similarity measure of each movie, with all other movies, We generally don't care much about least similar movies.
- Most of the times, only top\_xxx similar items matters. It may be 10 or 100.
- We take only those top similar movie ratings and store them in a saperate dictionary.

```
movie_ids = np.unique(m_m_sim_sparse.nonzero()[1])
```

```
start = datetime.now()
similar movies = dict()
for movie in movie ids:
    # get the top similar movies and store them in the dictionary

```

### 3.4.3 Finding most similar movies using similarity matrix

- \_ Does Similarity really works as the way we expected...?\_\_
- \_Let's pick some random movie and check for its similar movies....

|                              |        | movie_id |
|------------------------------|--------|----------|
| Dinosaur Planet              | 2003.0 | 1        |
| Isle of Man TT 2004 Review   | 2004.0 | 2        |
| Character                    | 1997.0 | 3        |
| Paula Abdul's Get Up & Dance | 1994.0 | 4        |
| The Rise and Fall of ECW     | 2004.0 | 5        |

#### Similar Movies for 'Vampire Journals'

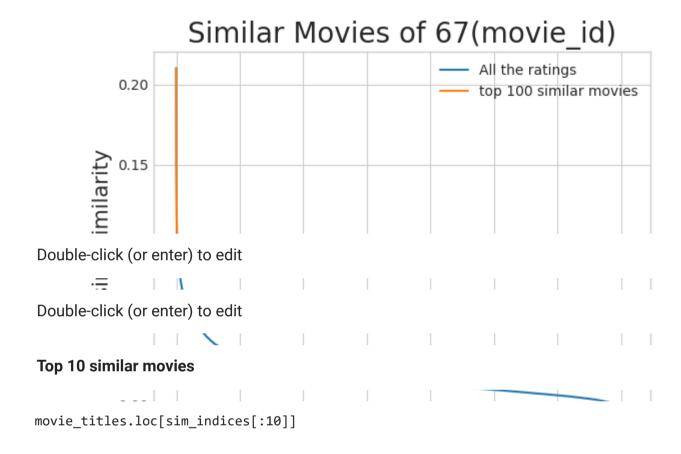

```
mv_id = 67

print("\nMovie ---->",movie_titles.loc[mv_id].values[1])

print("\nIt has {} Ratings from users.".format(train_sparse_matrix[:,mv_id].getnnz()))

print("\nWe have {} movies which are similar to this and we will get only top most..".format(m_m_sim_sparse[:,mv_id].getnnz()))
```

```
Movie ----> Vampire Journals
     It has 270 Ratings from users.
     We have 17284 movies which are similar to this and we will get only top most..
similarities = m m sim sparse[mv id].toarray().ravel()
similar indices = similarities.argsort()[::-1][1:]
similarities[similar indices]
sim indices = similarities.argsort()[::-1][1:] # It will sort and reverse the array and ignore its similarity (ie.,1)
                                               # and return its indices(movie ids)
plt.plot(similarities[sim indices], label='All the ratings')
plt.plot(similarities[sim indices[:100]], label='top 100 similar movies')
plt.title("Similar Movies of {}(movie id)".format(mv id), fontsize=20)
plt.xlabel("Movies (Not Movie_Ids)", fontsize=15)
plt.ylabel("Cosine Similarity", fontsize=15)
plt.legend()
plt.show()
```

|          | year_of_release | title                    |
|----------|-----------------|--------------------------|
| movie_id |                 |                          |
| 323      | 1999.0          | Modern Vampires          |
| 4044     | 1998.0          | Subspecies 4: Bloodstorm |
|          | 1000            | <b>-</b> 21              |

Similarly, we can *find similar users* and compare how similar they are.

# 4.3.2 Transforming data for Surprise models

from surprise import Reader, Dataset

## 4.3.2.1 Transforming train data

- We can't give raw data (movie, user, rating) to train the model in Surprise library.
- They have a saperate format for TRAIN and TEST data, which will be useful for training the models like SVD, KNNBaseLineOnly....etc..,in Surprise.
- We can form the trainset from a file, or from a Pandas DataFrame. <a href="http://surprise.readthedocs.io/en/stable/getting\_started.html#load-dom-dataframe-py">http://surprise.readthedocs.io/en/stable/getting\_started.html#load-dom-dataframe-py</a>

```
# It is to specify how to read the dataframe.
# for our dataframe, we don't have to specify anything extra..
reader = Reader(rating_scale=(1,5))
# create the traindata from the dataframe...
```

```
train_data = Dataset.load_from_df(reg_train[['user', 'movie', 'rating']], reader)
# build the trainset from traindata.., It is of dataset format from surprise library..
trainset = train_data.build_full_trainset()
```

#### 4.3.2.2 Transforming test data

• Testset is just a list of (user, movie, rating) tuples. (Order in the tuple is impotant)

```
testset = list(zip(reg_test_df.user.values, reg_test_df.movie.values, reg_test_df.rating.values))
testset[:3]
[(808635, 71, 5), (941866, 71, 4), (1737912, 71, 3)]
```

# 4.4 Applying Machine Learning models

Double-click (or enter) to edit

- Global dictionary that stores rmse and mape for all the models....
  - It stores the metrics in a dictionary of dictionaries

```

# 4.4.4 Surprise KNNBaseline predictor

from surprise import KNNBaseline

- KNN BASELINE
  - http://surprise.readthedocs.io/en/stable/knn\_inspired.html#surprise.prediction\_algorithms.knns.KNNBaseline
- PEARSON\_BASELINE SIMILARITY
  - http://surprise.readthedocs.io/en/stable/similarities.html#surprise.similarities.pearson\_baseline
- SHRINKAGE
  - 2.2 Neighborhood Models in <a href="http://courses.ischool.berkeley.edu/i290-dm/s11/SECURE/a1-koren.pdf">http://courses.ischool.berkeley.edu/i290-dm/s11/SECURE/a1-koren.pdf</a>
- predicted Rating: (\_based on User-User similarity\_)

$$\hat{r}_{ui} = b_{ui} + rac{\sum\limits_{v \in N_i^k(u)} ext{sim}(u,v) \cdot (r_{vi} - b_{vi})}{\sum\limits_{v \in N_i^k(u)} ext{sim}(u,v)}$$

- $b_{ui}$  Baseline prediction of (user, movie) rating
- $N_i^k(u)$  Set of **K similar** users (neighbours) of **user (u)** who rated **movie(i)**
- sim (u, v) Similarity between users u and v
  - o Generally, it will be cosine similarity or Pearson correlation coefficient.

• But we use **shrunk Pearson-baseline correlation coefficient**, which is based on the pearsonBaseline similarity ( we take base line

Double-click (or enter) to edit

• \_\_ Predicted rating \_\_ ( based on Item Item similarity ):

$$\hat{r}_{ui} = b_{ui} + rac{\sum\limits_{j \in N_u^k(i)} ext{sim}(i,j) \cdot (r_{uj} - b_{uj})}{\sum\limits_{j \in N_u^k(j)} ext{sim}(i,j)}$$

Notations follows same as above (user user based predicted rating)

# 5. Assignment

1.Instead of using 10K users and 1K movies to train the above models, use 25K users and 3K movies (or more) to train all of the above models. Report the RMSE and MAPE on the test data using larger amount of data and provide a comparison between various models as shown above.

NOTE: Please be patient as some of the code snippets make take many hours to compelte execution.

2. Tune hyperparamters of all the Xgboost models above to improve the RMSE.

```
%%javascript
// Converts integer to roman numeral
// https://github.com/kmahelona/ipython notebook goodies
// https://kmahelona.github.io/ipython notebook goodies/ipython notebook toc.js
function romanize(num) {
    var lookup = \{M:1000,CM:900,D:500,CD:400,C:100,XC:90,L:50,XL:40,X:10,IX:9,V:5,IV:4,I:1\},
    roman = '',
        i;
    for ( i in lookup ) {
        while ( num >= lookup[i] ) {
        roman += i;
        num -= lookup[i];
    return roman;
// Builds a  Table of Contents from all <headers> in DOM
function createTOC(){
    var toc = "";
    var level = 0;
    var levels = {}
    $('#toc').html('');
    $(":header").each(function(i){
        if (this.id=='tocheading'){return;}
```

**}**;

```
var titleText = this.innerHTML;
       var openLevel = this.tagName[1];
       if (levels[openLevel]){
       levels[openLevel] += 1;
       } else{
       levels[openLevel] = 1;
       if (openLevel > level) {
